/clone libe "Tritlicum adescivum FGAS: Library & CAF GAME 1. //noce="Organ: Crown and leaf; Vector: pCMV.SPORT6; Crown (50%) and leaf (50%) tissues from wheat cultivar Norstar after short exposure times to low temperature in the light and in the dark. L2 mRNA populations were combined before constructing the library. The first 6 populations: After 7 days of growth at 2005 from wheat cultivar Norstar after short exposure times to low temperature in the light and in the dark. L2 mRNA populations were combined before constructing the library. The first 6 populations: After 7 days of growth at 200, wheat plants were transferred to 4C in the light. Lam crown sections and green leaf tissu were separately harvested after 1, 3, and 6 hours of low temperature exposure. The last 6 populations: After 7 days of growth at 20C, wheat plants were transferred to 4C in the dark. Lam crown sections and green leaf tissu were separately harvested after 1, 3, and 6 hours of low temperature exposure. First strand synthesis in this library was done in the presence of methylated dCTP thereby protecting from internal cleavage with NotI. In addition, this library used a primer for second strand synthesis that annealed to an artificial sequence (RNA oligo) added before first strand synthesis. Therefore we masking step will have to be included to mask this RNA migner and common to all clones (sequences, an additional masking step will have to be included to mask this RNA migner and common to all colones (sequence). Email: fgas_ests@cs.usask.ca
This sequence is the direct result of the Base calling software
Phred (default parameters). It is the raw base calls. To aid in the
identification of the high quality insert the software Lucy
(default parameters) has been run on this sequence. Lucy identified
the region [21,782].
Plate: L68066 row: E column: 04.

/note="Vector: pBluescript SK+; Site_1: EcoRI (5'-end of CDNA); Site_2: XhoI (3'-end of CDNA); Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, SalI,PStI). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable."

/ Note="Vector: pSPORT1; Site_l: Sal1; Site_2: NotI; Plants were grown in a glasshouse. Anther meiotic stage was determined by removing anthers from individual primary florets. One anther was sacrificed for midvisdual primary florets. One anther was sacrificed for midviscopic staging, and if determined to be between (and including) meiotic stages pre-meiosis and metaphase I, the remaining two anthers were collected and pooled for library construction. The tissue, total RNA, and poly(A) RNA were prepared, cDNA synthesised, and directionally ligated into pSPORT1 by Tim Sutton in the P Langridge Lab at the Department of Plant Science, University of Adelaide, Waite Campus, Australia. Average insert size 1.5Kb, Plasmid DNA Anderson lab (all other authors)."

{	Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete.
SS :	Claim 5; Page 33; 34pp; English.
¥88888888888	The present invention relates to novel polymucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attp) which are isolated from pMLP1, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polymucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic products such as hybrid antiblocics. The present sequence is pMLP1 attp site DNA from Micromonospora carbonacea

```
(int) and excisionase (xis) and an integrace attachment site (attP) which are isolated from pMnPl, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polymucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic products such as hybrid antibolics. The present sequence is pMnPl attP DNA from Micromonospora carbonacea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel polynucleotides encoding integrase

The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attp) which are isolated from pMLP1, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also chromosomes. The integrating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic products such as hybrid antibictics. The present sequence is pMLP1 attP/attB right juncture DNA from Micromonospora carbonacea
                                                                                    Integrase, int, excisionase, xis; integrase attachment site; putP; pMLP1; site-specific integration; hybrid antibiotic; metabolic product; attB; secondary metabolic pathway; attB/attP DNA; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete.

The sequence encodes 2 integrases which permit site specific integration of a vector into an actinomycete, especially a Micromonospera, genome. The invention relates to nucleic acids and vectors comprising a M. carbonacea everninomicin biosynthetic pathway resistance gene product useful for selecting for a transfected or transformed host cell. An integrative version of the vector is useful for introducing a eventinomicin pathway gene (a bottle-neck gene) into an actinomycete of the genus Micromonospora. The DNA encoding the biosynthetic proteins is useful for synthesising novel everninomicin-related compounds, arising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecules encoding everninomicin pathway gene products, useful for improving yields of everninomicin, to produce new everninomicin and as probes to identify homologous sequences.

modified orselling acid groups contained in everninomicin, for expressing functional or mutant everninomicin biosynthetic enzyme for explessing functional or mutant everninomicin biosynthetic enzyme for explantion, diagnosis and preferably biosynthetic enzyme for other secondary metabolic products, improving the yield of everninomicins and to produce novel everninomicins and also as a hybridisation probe to dentify homologous sequences. The encoded polypeptides are useful for combinatorial biosynthesis to generate libraries of orthomycins, e.g. everninomicin analogues/homologues and drug discovery. The DNA encoding everninomicin analogues/homologues and drug discovery. The DNA encoding the integrase allows for increasing a given gene dosage. The integrate allows for increasing a given gene dosage. The integrate genes of choice into chromosomes of different hosts and to integrate genes of choice into chromosomes of different hosts and to integrate genes to which increase the yield of known products or to generate novel products cuch as hybrid antibiotics or other novel secondary metabolites. The correct can also be used to integrate antibiotic resistance genes in order to carry out bioconversions with compounds to which the strain is commanly sensitive and is thus useful in fermentation processes involving e.g. field)

The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attp) which are isolated from pMLPI. A bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. Africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also chromosomes. The integrating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic attp?AttB right juncture DNA from Micromonospora halophitica. (Updated on 07-AUG-2003 to correct OS field.) Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete. Claim 23; Fig 5; 34pp; English.

The present invention relates to novel polynucleotides encoding integrase (int) and excleionase (xis) and an integrase attachment site (attp) which are isolated from pWLP1, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also chromosomes. The integrating vectors are used to express actinomycete products such as hybrid antibolic pathways and create new metabolic products such as hybrid antibolics. The present sequence is pMLP1 attB DNA from Micromonospora carbonacea Integrase, int, excisionase, xis, integrase attachment site, attP; pMLP1; site-specific integration; hybrid antibiotic; metabolic product; attB; secondary metabolic pathway; attB/attP DNA; ds. Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete.                                                                                                                                                                                                                                                                                     The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attP) which are isolated from MILPI, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic products such as hybrid antiblotics. The present sequence is pMLPI attB/attP left juncture DNA from Micromonospora carbonacea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Integrase; int; excisionase; xis; integrase attachment site; patP; pMLP1; site-specific integration; hybrid antibiotic; metabolic product; attB; secondary metabolic pathway; attB/attP DNA; ds.

```
The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attP) which are isolated from pMLPI, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integration ectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic attB/attP left juncture DNA from Micromonospora halophitica. (Updated on 07-AVG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Integrase, int, excisionase, xis, integrase attachment site, attP, pMLP1, site-specific integration, hybrid antibiotic; metabolic product; attB; secondary metabolic pathway; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete.

                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attp) which are isolated from pMLP1, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention as te useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete products such as hybrid antibiocics. The present sequence is PMLP1 attB DNA from Micromonospora halophytica. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention iseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL3651), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB77072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a DNA (I) that: (i) (AB226077-AB226079) encodes any of three splice forms of murine DNasax (II) of 295, 295 and 61 amino acids (ABS604047ABS60405); (ii) is a 40116 by genomic sequence (AB226080) (i or (iii) encodes a protein (IIa) with the biological properties of (II) and is a fragment or allelic or other variant of (i) or (ii). DNase X (Gegrades DNA inducing apoptosis, immunogenic DNA complexes inhibiting the immune response in systemic lupus erythematosus and mucus in the lungs of immune response in systemic lupus erythematosus in the lungs of cystic fibrosis patients. (I), vectors containing (I) and the encoded contents (II), are used to diagnose, prevent or treat diseases associated with apoptosis, specifically systemic lupus erythematosus, acquired immune deficiency syndrome, cancer, cystic fibrosis and prostatic carrophy. Also (I) and (I) can be used to screen for specific binding carrophy. Also (I) and (I) can be used to screen for specific binding carrophy. Also (I) and (I) can be used to screen for specific binding carrophy. Also (I) and curvated) are used to study the specified diseases and/or to characterise genes and/or for testing potential therapeutic agents. The present sequence is that of mouse DNasax encoding construction.
                                                                                                                                                                                                                                (DEKR-) DEUT KREBSFORSCHUNGSZENTRUM
                                                                                                                                                                                                                                                                                                                         New DNA encoding murine DNaseX antibodies useful for treating systemic lupus erythematosus,.

The invention relates to the ssrA gene or tmRNA, an RNA transcript of the strA gene, or fragments thereof as target regions in a nucleic acid probe assay for the detection and identification of prokaryotic and/or enkaryotic organisms. The invention also relates to 38 novel ssrA send to the content of the content of the strA gene (tmRNA-directed probes and for content of genus- and species-specific strA gene/(tmRNA-directed probes and FCR primers (claimed). tmRNA is a stable, high copy number RNA which is found in all bacteria and is also found in chloroplasts and diatoms. It has a dual function both as a tRNA and as an mRNA and is involved in rescuing truncated mRNAs which have lost stop codons. SarA genes and tmRNA sequences can be used as target regions in nucleic acid probe assays for the detection, identification, or quantification of a prokaryotic or cutaryotic organism. cDNA transcripts of temRNA molecules may also be used as probes for in vitro or in situ nucleic acid hybridisation assays. A sequence content of molecule corresponding to a region of high homology from the 5' end or the 3' end of the DNA molecule corresponding to a region of high homology can be used as a target region in a nucleic acid probe assay, while a cutaget regions may be used as the basis for amplification of probes. These regions may be used as the basis for amplification of prokaryotic or enkaryotic organisms, and in a multiple probe format for broad scale detection of prokaryotic or elkaryotic organisms. And in a multiple probe format for broad scale detection and probe surface to the transcript can be used as the basis of an assay to obtain a DNA gene probe or a tmRNA transcript probe can be linked to a microarray gene probe or a tmRNA transcript can be used as the basis of an assay to obtain a DNA gene probe or the tmRNA transcript can be used in an assay to obtain a DNA system for the broad scale high throughput detection and calculation of prokaryotic or elkaryotic organisms. And in a multiple propers or a tmRNA transcript 
                                                                                                                                                       ssrA gene, tmRNA, or fragments of them, as target regions in probe for detection of prokaryotic or eukaryotic organisms, and for

The invention relates to the ssrA gene or tmRNA, an RNA transcript of the stard gene, or fragments tharefd as target regions in a nucleic acid probe assay for the detection and identification of prokaryotic and/or eukaryotic organisms. The invention also relates to 38 novel ssrA sequences and their tmRNA transcripts (claimed), and to penn bacterial, genus- and species-specific stard gene, tunkA is a stable, high copy number RNA which is found in chloroplasts and diatoms. It has a dual tunction both as a tRNA and as an mRNA and is involved in recound truncated mRNAs which have lost stop codons. StrA genes and tmRNA secured probes and thRNA secured mRNAs which have lost stop codons. StrA genes and thRNA and securing truncated mRNAs which have lost stop codons. StrA genes and tmRNA acception or quantification of a prokaryotic or eukaryotic organism. cDNA transcripts of tmRNA molecules may also be used as a universal target regions in mucleic acid probe assays. A tragment of the strA gene or a tmRNA molecule corresponding to a region of the stranger region in a nucleic acid probe assay, while a suniversal target region in a nucleic acid probe assay, while a fragment of the strA gene or a tmRNA molecule corresponding to a region of the stranger region in a nucleic acid probe assay, while a fragment of the stranger region in a tructain of probes. These regions may also be used as the basis for ann assay for distinguishing between living and dead prokaryotic or eukaryotic or gene probe or a tmRNA transcript can be used as the basis of the strA gene or the broad scale high throughput detection and contrary gene probe or a tmRNA transcript can be used a prokaryotic organisms, and in a multiple probe format for broad scale detection and/or identification of prokaryotic organisms. A fragment of the strA gene or the tmRNA transcript can be used to monitor the strA gene, the tmRNA transcript can be used to gene probe or a tmRNA, or a fragment where sagents in medicine, and assertions and target regions may be used to monito

The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, protein, or in generating antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence is useful for down part of the printed specification, but was obtained in electronic formet directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                                                                      Human; ss; sequencing by hybridisation; SBH; expressed sequence tag; EST; genome mapping; biodiversity; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 438;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 28,

FEATURES

```
(http://www.jax.org/resourced/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwdy2 (gql #4722114|gpl A712972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Killo-Gold (stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mus musculus

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of puble [A732114]gal A1292(2.1); a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chamically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated for sheared DNA
was but end repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AT129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent B. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CG962621 425 bp DNA linear GSS 15-DEC-2003

Clones are derived from the bovine BAC library CHORI-240

(http://www.chori.org/Dacpac/boxine240, htm). For BAC library

availability, please contact Pierer de Jong (pdejong@mail.cho.org).

Clones may be purchased from BACPAC Resources

(http://www.chori.org/Dacpac/ordering information.htm). This work

was undertaken as part of the International Bovine BAC Mapping

Consortium (IBBMC) by AgResearch Ltd., New Zealand and The

Institute of Genomic Research (TIGR), USA.
